

Doxygen uses the dot.exe program from Graphviz. So Doxygen needs to know where dot.exe is.

You can tell Doxygen by setting the value of DOT_PATH. See below.

Go to Expert mode. Select Dot. Tick everything.

Enter the path where dot.exe is found. This would be where graphviz's bin directory is found. Double check that the file dot.exe is there.

You would have installed Graphviz in different location. Use the location that is relevant for your machine.

Once you have made the changes, click Next, go to File menu and save the configuration file (doxyfile). Use a copy of this configuration file with each lab and assignment.
